

Garage Door Maintenance

The panel garage door controller is programmed to provide an alert after 1500 operations. This alert is a series of beeps from the controller when the door is opened. Normally there are no beeps.

This is a reminder to have the door mechanism checked and lubricated to maintain correct operation. This can be organised through Steeline Doors people or other appropriate service providers. The reminder beeps can then be removed by programming the controller.

Please note that our doors have a rubber belt in place of the metal chain. This should not be lubricated.

Lithium Grease can be purchased from any hardware or auto parts stores.
